

National Severe Weather Warning Service

Chief Forecasters Assessment

A very warm and rather humid airmass will cover Scotland today. Despite relatively high pressure, this heat and humidity could well set off some scattered thundery showers across Southern Scotland. Where these occur, isolated accumulations of 10-15 mm in an hour are likely, with a low risk of 20-25 mm in the worst affected locations. There is considerable doubt about the extent of these showers and as is usual with these situations, most areas will escape the worst.

The Met Office have issued a **Yellow Warning of Rain**

Valid from **15:00 on Tue, 17th Jun 2014** until **22:00 on Tue, 17th Jun 2014**

Scattered heavy, thundery downpours are likely to break out from mid-afternoon and last into the evening, across parts of Central and Southern Scotland. These could lead to some localised surface water flooding, particularly on the road network and more especially if the downpours affect urban areas. The public should be aware of the risk of localised disruption to travel and perhaps isolated cases of minor property flooding.
